Professional Summary

Computer Science recent graduate from King Faisal University with hands-on cloud-native operations experience gained through a six-month cooperative training at SDAIA's national private cloud. Skilled across the full DevOps lifecycle — Kubernetes, Docker, GitOps, CI/CD, and Infrastructure as Code — with production experience on both AWS EKS and an air-gapped enterprise private cloud.

Work Experience

Cloud Platforms Operations — Cooperative Training, SDAIA

Jan 2026 – Present
Riyadh, Saudi Arabia

- Administered Linux-based workloads on Deem, SDAIA's air-gapped national private cloud (Huawei Cloud Stack / CCE), operating containerized services across Docker, Docker Compose, and Kubernetes in a restricted enterprise environment.
- Deployed 5 multi-service stacks (Nginx, PostgreSQL, RabbitMQ, Gitea) on an air-gapped CCE cluster using ConfigMaps, Secrets, and PVCs — resolving image-transfer constraints unique to isolated environments.
- Cut deployment time to ~3 minutes and eliminated manual drift by building an ArgoCD GitOps pipeline on AWS EKS with automatic self-healing (recovery within 30 seconds).
- Implemented progressive delivery with the Istio service mesh, running canary traffic splits (90/10 → 50/50) via the Gateway API and verifying distribution under load.
- Reduced vulnerable dependencies reaching production to zero by embedding SAST, image scanning, and Dependabot into GitHub Actions pipelines, enforced via branch protection.
- Established cluster-wide observability with Prometheus and Grafana — configured RBAC-based service discovery and built custom dashboards, enabling real-time visibility into node and pod health instead of manual log inspection.

Projects

Capstone — Air-gapped GitLab CE deployment on Deem:

provisioned a VPC, CCE cluster, and ARM64 worker nodes; prepared a matching arm64 image and transferred the multi-GB image into the internal SWR registry; deployed as a StatefulSet with resource limits and readiness probes, exposed via Service for Ingress, and diagnosed EVS persistent-storage limits with a documented workaround.

Cloud-native Task Tracker (end-to-end GitOps + CI/CD):

built a Python **FastAPI** REST API with health and Prometheus /metrics endpoints, containerized with a multi-stage Dockerfile; deployed to **AWS EKS** with EBS-backed storage; full ArgoCD GitOps loop auto-deploying on every commit (~3 min) through a lint → test → scan → build → push pipeline with staging/production gates.

Education

Bachelor of Computer Science, King Faisal University

Sep 2020 – Jul 2026
GPA: 4.59 / 5.00

Skills

Cloud & Containers:

AWS (EKS, EBS), Huawei Cloud Stack / CCE, Kubernetes, Docker, Docker Compose

CI/CD & IaC:

GitHub Actions, ArgoCD (GitOps), Terraform, Istio, DevSecOps (SAST, Dependabot)

Observability:

Prometheus, Grafana

Languages:

Python, C++, Java, SQL

OS, Scripting & Tools:

Linux, Bash, Git / GitHub, YAML, kubectl, CLI

Awards & Honors

Ambassador of Excellence, King Faisal University

Honored under the patronage of His Royal Highness Prince Saud bin Talal bin Badr Al Saud.

Oct 2023

Third Place, Social Responsibility Hackathon

Won 3rd place for developing a job-simulation platform helping students discover their ideal academic major through hands-on career experiences.
